A: Try this $ md5sum mspdos-7.10.iso md5sum 5a4e30e7155f5ce9b6306f7ea6f4c239 mspdos-7.10.iso Or $ sha1sum mspdos-7.10.iso sha1sum 5a4e30e7155f5ce9b6306f7ea6f4c239 mspdos-7.10.iso And as per the answer, use WinDBG and use!dumpexts *.mbm and!dumpexts *.mbi Q: Why does the JVM need to be restarted for new class loading to occur? I have a single main program, and sometimes I want to read a class file of one of the libraries added to the classpath. To use reflection, I need to restart the JVM, because classloading occurs from the beginning. My question is, why can the classpath be read at all after the JVM has already been started? Wouldn't it make sense to only have the class path added when the program is started? I am aware that this is not a newbie question, but I thought it would be interesting to ask why the JVM "needs" to be restarted to load new classes. A: Short answer is because the classloader does need to be restarted. As you understand reflection can be used for loading classes in the classpath even if the VM has already started. The classloader is part of the VM and if you want to load new classes while the VM is running it needs to be restarted. Wouldn't it make sense to only have the class path added when the program is started? Absolutely not. The point of the classpath is to be loaded when the program is started. If the classpath was only loaded when the program was started then existing code would have to be changed to adapt to the new classpath configuration. This would mean a lot of work and it could break existing code. Think about it in the opposite way. Imagine if it was possible to update the classpath at any time. A hacker could break their code easily by loading a malicious library on the classpath. How would you protect against this? You'd want to require a

Jan 25, 2021 Ms-Dos Version 7.1 cd image. by: Microsoft. Publication date: 1996. Topics: msdos. Language: English. The newest MS-DOS i think. Nov 21, 2021 The newest MS-DOS i think.. MS Dos 7.1 CD. Topics: msdos, microsoft. Language: English. The newest MS-DOS i think. A: A Boot Disk is a pre-boot environment that is installed onto a separate hard drive or a bootable USB/CD and provides basic commands to perform basic system setup and operations. MS-DOS 7.10 CD-Rom Q: How to generate a 3-letter country abbreviation? I have the following table which holds country names: +-------------+ | code | +------------+ | DE | | GB | | USA | | AU | | SE | | FR | | CL | +-------------+ I'd like to generate 3-letter country abbreviation, i.e: DE -> DEU, GB -> GBR, etc. I don't want to use any library which provides this as they may change the order. Any ideas? A: Since your are looking for a replacement of the "standart" 3 letter country abbreviation I would solve this kind of problem with some kind of normalization function that uses ngrams and tries to keep the count of a ngram to 1 in the input columns. By using a trigram you will have more or less "normal" output. A simple way to achieve this is not to make it exact, but to "guess" a country from a string based on a very reduced vocabulary of only the most commonly used "3 letter" words. This algorithm might be a simple based on normalization functions or other f678ea9f9e
